

Add games/BIOS files to Batocera

Batocera will only show the systems for which ROMs are installed for. As more ROMs are added for different systems, more systems will be shown. To update the game list, press [START] and go to **GAME SETTINGS → UPDATE GAMESLISTS**.

Batocera is shipped with a selection of free ROMs - games that are freely available and that can be legally distributed. You can also install additional free games from the [Content Downloader](#). All artwork is pre-scraped for use with themes, including video previews. These can be used to test that everything is working correctly. If you'd like to add your own ROMs and BIOS files, read on.

If you've got a large set of ROMs and would like to cut down on duplicates/languages you don't need, you can use external tools such as [Romulus](#) alongside [unexpectedpanda's retool](#) utility. For arcade games specifically, it's recommended to first read [the dedicated arcade guide](#) first. Then, a tool such as [Voljega's BestArcade](#) can be used to create a curated set.

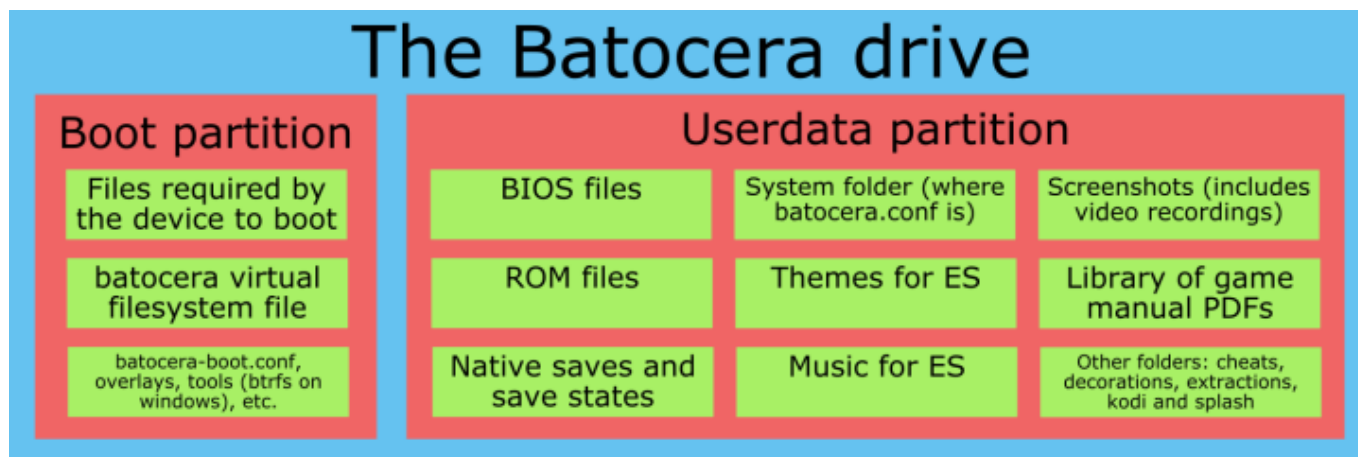

If you've already copied your ROMs over to Batocera and would like to cut down in a simpler manner, you can use tools that can be run inside of Batocera such as [andrebrat's 1g1r-romset-generator](#) instead. Just follow the instructions from its [Getting Started](#) guide, installing the script to a folder in Batocera's network share and running the commands [via SSH](#). It's also possible to do batch gamelist editing with [ARRM](#) or [RobG66's Gamelist Manager](#).

If you are coming from Retrobat, there is [a community script](#) that can automate the process. Most folders are identical between the projects, though.

Accessing Batocera's drive to add files

If you would like to add your own ROMs and BIOS files, you must first gain a way to access Batocera's userdata [partition](#) (labelled as SHARE). It is separate from the boot partition, as can be seen in this infographic:

Once access to the SHARE is gained, refer to the [BIOS](#) and [ROM](#) sections below.

Batocera accommodates for multiple ways to access its drives, which can be categorized into three categories:

- [Transferring the data while Batocera is running](#) (the easiest method for most situations)
- [Copying directly from another machine onto the Batocera drive](#); and
- [Using an external storage](#).

While Batocera is running

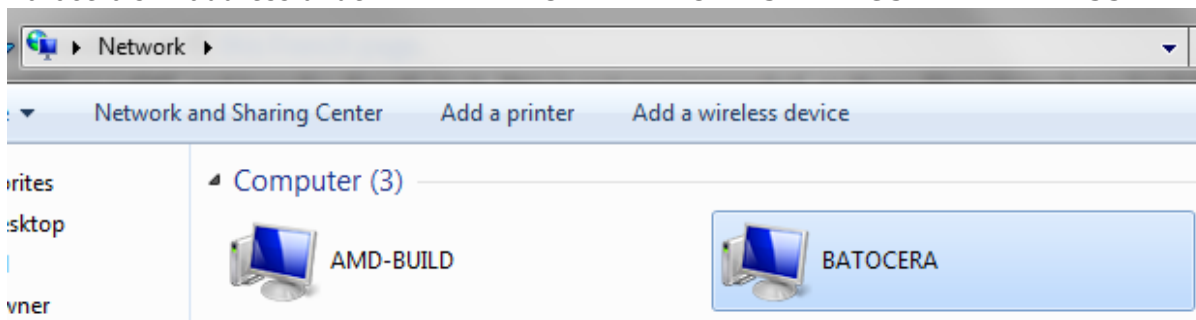

Each of these methods require Batocera to be up and running first. You can choose any method listed in this bullet point list, not all of them need to be done at once.

- On PC (x86, x86_64) and RPi4 platforms, open the [built-in file manager](#) ([F1] on the keyboard while on the system list) and transfer the data using the Batocera machine itself. eg. put all your ROMs onto a USB drive, plug it into the Batocera machine while it's running and copy them over.

- Open the controller-friendly OD-Commander in the Ports system and transfer the data using the Batocera machine itself. eg. put all your ROMs onto a USB drive, plug it into the Batocera machine while it's running and copy them over.
- Add them from a different computer while Batocera is running, through the network share. This share is turned on by default, nothing needs to be done in Batocera. To connect to it from a different machine:

1. Open your file explorer of choice and find its "Network" section. If using Android, [CX File Explorer](#) is a free app which supports this.
2. Find the **BATOCERA** device and enter its "share" folder. If it's not appearing, directly type \\BATOCERA\share (under Windows or MacOS) or smb://BATOCERA.local/share (under Linux) in the address bar to directly navigate to it. If your router doesn't support hostnames properly (many old routers do not), type in the IP address of the Batocera machine instead of the hostname (for example, \\192.168.1.2\share). You can find Batocera's IP address under **MAIN MENU** → **NETWORK SETTINGS** → **IP ADDRESS**.

If you are having trouble access the network share, be sure to check out [the network issues page](#).

In case **BATOCERA** is not appearing on the “Network” section, but you can still access it via its hostname, it's possible to create a permanent shortcut to that network location:

▪ **On Windows:**

1. Open “This Computer” and right click an empty space. Select **Add a network location**.
2. Click **Next** twice.
3. Type in the address from which you can access the Batocera share and click **Next**.
4. Give the shortcut a custom name if you wish, then click **Next** again.
5. Click **Finish** and the network location shall now appear in **This Computer**

▪ **On Linux:**

1. Open your preferred file manager.
2. Mount the network share however way it's normally done.
3. The share should appear in the sidebar, right click and select the equivalent of “bookmark” or “pin”.
4. The share will now always be available in the sidebar.

To instead map the hostname itself as a network drive

▪ **On Windows:**

1. Navigate to \\BATOCERA (in case the host name is not working and you'd still like to use this method, you can just enter the IP address here, but you'd also need to assign Batocera a static IP address from your router, which is outside of the scope of this guide)
2. Right click on Batocera's “share” share
3. Select **Map Network Drive...**

4. Select a letter for the drive and confirm with **Finish**

5. The drive mapped to Batocera's SHARE will now be available in **This Computer**

▪ **On Linux:**

1.  (just search up "fstab" for your OS)

- Use [WinSCP](#) to transfer from another computer to the Batocera machine via SSH/SFTP.

- As an alternative to the built-in file manager, [Midnight Commander](#) can be used in an SSH terminal to copy files. To use it, [sign in via SSH](#) and run `mc`.

- If you know your way around SSH/terminal, the `cp` and `mv` commands can also be used directly.

Copying directly from another OS

This is by plugging the Batocera drive into another machine (or from another OS on the same machine), and copying your files from there directly onto the SHARE partition.

If using any of these methods, be sure to boot Batocera at least once to allow it to auto-expand the userdata partition to fill the rest of the drive. Otherwise, it will only be 512 MB large!

- Directly copy the ROM/BIOS files onto the **userdata** partition on a computer that can natively write to ext4 filesystems (any OS that supports the ext4 filesystem should work).
 - When the Batocera drive is connected, two partitions will appear. One labelled BATOCERA, which is the boot partition, and another labelled SHARE, which is the userdata partition. Copy your [games/BIOS](#) files appropriately into the SHARE partition. Windows is unable to read Linux formatted filesystems by default, either reformat the userdata to a simpler filesystem, add additional unofficial drivers to Windows (described below) or use a more robust OS.

▪ In Windows:

Be warned that there have been user reports of Windows/iOS failing to copy over the data successfully when interacting with Linux-formatted partitions, resulting in weird issues such as files disappearing. For most users, this is not an issue. If you have any doubts, [use Batocera itself to copy the data over while it's running](#).

For a simple solution, [Disk Genius](#) can be used to [read and write to ext4 partitions](#). The free trial only allows “small” files to be copied over.

Alternatively, an ext4 Windows system driver such as [Ext2Fsd](#) can be [downloaded](#) and installed. Be wary that it's an unstable kernel driver which no longer receives updates. Alternatively, use one of the modules from [this French page](#).

Using WSL2 to mount ext4 partitions on Windows 11

As preamble, if you're going to this extent to fix broken features in Windows, you may as well just install Ubuntu in a VM and enable guest additions to allow for drag and drop. It would be much simpler.

If you are using Windows 11 (or Windows 10 Insider Build 20211) or above, [its WSL 2 feature allows for the mounting of ext4 filesystems](#) (this requires a Linux distro to be installed in the WSL2, and [a bug prevents devices detected as flash drives from being read](#)):

1. Open a PowerShell window with administrator privileges
2. If WSL is currently disabled:
 1. Type in `Enable-WindowsOptionalFeature -Online -FeatureName Microsoft-Windows-Subsystem-Linux` and press [Enter]
 2. Restart the computer when prompted
 3. Open Powershell with administrative privileges again
 4. Install a Linux distro in WSL2. This can be accomplished by typing in `wsl --install --distribution Ubuntu` and pressing [Enter]

- List all currently available disks to mount by typing in `wmic diskdrive list brief` and pressing [Enter]

```
PS C:\Windows\system32> wmic diskdrive list brief
Caption                                DeviceID                                Model                                    Partitions  Size
KINGSTON SA2000M81000G                \\.\PHYSICALDRIVE0                    KINGSTON SA2000M81000G                 3           1000202273280
iXpand Flash Drive USB Device         \\.\PHYSICALDRIVE1                    iXpand Flash Drive USB Device         2           31914086400
```

- Then type `wsl --mount <DiskPath>` (where `<DiskPath>` is replaced with the intended disk, for example `wsl --mount \\.\PHYSICALDRIVE1`) and press [Enter] again
- The partition will now appear in the sidebar of file explorer under the "Linux" group (or alternatively manually navigate to `\wsl$`)
- To unmount the disk, type `wsl --unmount <Diskpath>`

▪ In MacOS:

If you are using MacOS, it is recommended to use the network transfer method (followed by the virtual machine method mentioned in the next bullet point). If you are already familiar with the inner workings of MacOS, have built software from its source before, have homebrewed your system and are okay with introducing instability to your system, a native solution to read ext4 partitions is available. [macFUSE](#) with [fuse-ext2](#) can be used to read and write to ext4 partitions. A very brief guide (**this is untested, refer to the Github page to be aware of the proper method**, to quote the driver one last time "This is experimental code, opening rw a real file system could be dangerous for your data. Please add `-o ro`" if you want to open the file system image in read-only mode, or `-o rw+`" if you accept the risk to test this module"):

- Install Homebrew for your system. This will not be covered as it is its own ordeal, not intended for regular users anyway.
- Install macfuse: `brew install --cask macfuse`
- Install fuse-ext2: [brew method](#) or [manual compilation](#).
- Discover which disk it is that contains the Batocera userdata: `diskutil list`
- Mount the disk (where `/tmp/test-fs.ext4` is the path to the disk desired):

```
/opt/gnu/sbin/mkfs.ext4 /tmp/test-fs.ext4
mkdir -p ~/mnt/fuse-ext2.test-fs.ext4
fuse-ext2 /tmp/fuse-ext2.test-fs.ext4 ~/mnt/fuse-ext2.test-fs.ext4 -o rw+,allow_other,uid=501,gid=20
```

- Use a virtual machine of an OS which can natively read ext4 filesystems, along with a plugin that allows transfer between the virtual machine and the host system. [Oracle Virtualbox](#), [VMWare](#) and if you have Windows Pro or superior editions [use its built-in virtual machine tool](#), [Hyper-V](#).
- Format** your **userdata** partition to an older filesystem compatible with more OS's, such as NTFS or exFAT, and copy the files directly to it. This is not recommended, as [those filesystems have limitations](#).
- In Batocera **5.26** and higher, **format** your **userdata** partition to BTRFS and transfer directly to it.

On Windows, you can install the `btrfs_for_windows` driver from the `tools/` folder on the Batocera drive. Check its readme on how to install it. If using secure boot, [an additional workaround is needed](#).

“For the very latest versions of Windows 10, Microsoft introduced more onerous requirements for signing, which seemingly aren't available for open-source drivers. To work around this, go to `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\CI\Policy` in Regedit, create a new DWORD value called `UpgradedSystem` and set to 1, and reboot. Or you could always just turn off Secure Boot in your BIOS settings.”

Using an external storage

Alternatively, you can skip having to access Batocera's internal drive all together by instead commanding Batocera to use an external storage.

- [Use an external drive for storage](#). The same [limitations about filesystems](#) still apply, but this is easier to reformat to another file system with.
- [Use a Network Access Storage \(NAS\)](#). The same limitations about filesystems still apply, but this is easier to reformat to another file system with.

Adding BIOS files

BIOS files are files required for some emulators to operate correctly. For example, some of the PlayStation and the NeoGeo games require a BIOS file to work.

All of these go into the `bios/` folder in the SHARE partition.

BIOS files are copyrighted and are therefore not included with Batocera. We can not legally distribute them, so you will need to supply your own.

What about arcade games? For arcade emulators, it's a little more complicated: many arcade boards were designed for one specific game, or just a few games. And most cases, you don't need BIOS files, but [you might still need some specific additional files as described on this page](#). For other arcade systems, like Atomiswave or Naomi, they need a proper BIOS file, as listed below.

List of BIOS files that are suitable

The md5sum command to get the checksum of the BIOS files, but the easiest way is to check **MISSING BIOS** from the **SYSTEM SETTINGS** menu, it will show the required path and md5sum of every BIOS file needed for each system. This is always up to date with the current version of Batocera installed.

A text document of the BIOS files required by the emulated systems can be found at `bios/readme.txt`. Use [the terminal command](#) `more /usr/share/batocera/datainit/bios/readme.txt` to quickly scroll through it ([Space] to scroll, [Q] to quit).

The BIOS checker tool itself can be run itself with `batocera-systems` (takes a while to process, give it a minute or two). Not all "missing" BIOS files are required, most emulators will still run without them and you don't need the BIOS files for any system you aren't intending on playing.

You can find the current list of required and soon-to-be-implemented BIOS files directly on the [Github repository](#).

Here is the list compatible md5 and filenames per system, last updated for Batocera **v36**:

Click to expand the list.

```

Adding ROMs

The roms/ folder contains all the folders for all the systems available on your platform. Adding more folders will not add the system to Batocera; if the folder for that system isn't there then the emulator for that system is not present on your platform.

When installing your own ROMs, make sure that you have them in a suitable format for the emulators you are going to use. For example, if you want to add a NES ROM, make sure that your ROM file extension is listed in the roms/nes/_info.txt file. For this particular system, acceptable ROM formats are .7z .nes .zip, so an acceptable game would be beans.nes. You have one _info.txt file in each ROM system directory by default. New _info.txt files are added as new systems become available. Descriptive names for each system can be found on [the system page](#).

By default, Batocera will hide systems which do not have ROMs present on the drive in the system list. Once ROMs in the right format are added to the appropriate folders and the gamelist is refresh, the new systems will appear.

When multiple emulators are available for the one system, but not all of them accept the same ROM formats, you'll get prompted with a message telling you that your ROM might not be used with the emulator selected when you try to launch a game in an incompatible format. Most of the time, at least. If not sure, refer to the aforementioned _info.txt file.
