

## Scrape From

This option is to allow you to change the source of where your images are coming from. It allows you to choose from [theGameDB](#), or [Screenscraper](#).

Screenscraper offers more options for game scraping (for example several image options, you can scrape video previews, etc.). But there is also a **limitation in the number of assets you can download each day**: 50,000 requests max per day. Also, if you use a "mix" for the image, be aware that you need to download a screenshot + box + game title/marquee, which are 3 downloads for 1 composite image.
