ScreenSaver Behavior

Batocera currently provides 4 different screensaver modes:

- **Dim**: simply dims the screen
- **Black**: turns the screen full black (default)
- **Slideshow**: displays on full screen screenshots that have been scraped for the games available on your system (on rotation after a given time). This behavior can be configured from Slideshow Screensaver settings.
- **Random Video**: this one has two modes:
  - First, you can use it to display snap videos that have been scraped for the games available on your systems. If you press the `Start` button while a video is played, the associated game will be launched directly! Some call it “demo mode”. And if you don't like the game on screen, press `right` to skip to the next video
  - Starting with Batocera 5.27, you can also use **Random Video** to play videos from a custom folder (by default `/userdata/screenshots/`). Drop a few videos for old video game commercials in there, and sit back for some nostalgia. And if there is a video you don't like, just press `right` to skip to the next.
  - Configuration of video screensavers is done through Random Video Screensaver settings.
