

Cannonball (enhanced OutRun)

Cannonball is a complete rewrite of [Sega Out Run arcade racer](#), features several enhancements to the original game: higher frame rate at 60 fps, higher resolution sprite scaling, wide screen support, new game modes and so on.

Enable Cannonball

Most users will be fine with the arcade and console versions of OutRun, so by default, Cannonball is disabled.

To enable it, go to `/userdata/roms/cannonball/` or `\SHARE\roms\cannonball\` from the SMB network and rename the file `Cannonball.disabled` into `Cannonball.cannonball`.

Install ROM files

Cannonball requires the original Outrun ROM Revision B files to play the game. Contrary to MAME or FBNeo, you need to unzip the ROM files in the `roms/cannonball/` folder. The list of ROM files required is [available from this link](#) on Cannonball's Github.

Severa ROM zip files can be used to extract the OutRun data files. Make sure yours in one of following (using the command `md5sum outrun.zip` or `md5sum cannonball.zip`):

```
fe803998a14837227be83d0f30f29a23  outrun.zip
dbf3c379a3664d9c920cada5dc4cdc23  outrun.zip
a7060972e1cb854c111a435cc965cf29  cannonball.zip
```
