MAME

MAME, the Multiple Arcade Machine Emulator, is a multi-purpose emulation framework which facilitates the emulation of vintage hardware and software. Originally targeting vintage arcade machines, MAME has since absorbed the sister-project MESS (Multi Emulator Super System) to support a wide variety of vintage computers, video game consoles and calculators as well. MAME doesn't use an individual “core” for each system like RetroArch does, instead the ROM itself usually contains the necessary information to accurately emulate it, thus making it specific to the version of MAME it was made for. Overall it's a very complicated subject, we have a guide specific to arcade just for it.

It was first released in 1997. In Italy!

MAME games scrapes metadata for the “arcade” group(s) and loads the name set from the currently selected theme, if available.

It is highly recommended to read the generic arcade guide first to get familiar with arcade machine emulation first. It's far more complicated than standard home video game console emulation.

Quick reference

- **Accepted ROM formats:** .zip, .7z
- **Folder:** /userdata/roms/mame

BIOS

Based on the romset type used, either none is required, ones are required for each game you need to play, or a single BIOS file is needed for a group of games.

Samples

Some arcade game machines featured additional storage that allowed for uncompressed audio to be
utilized. These are referred to as “samples”. Some machines had a backup synthesized track if the samples weren't present, others had none.

For MAME2003plus (mame078plus), if your game has the appropriate samples, place them in /userdata/bios/mame2003/samples folder. Samples can be for one specific game, or be applicable to multiple versions of the game.

**ROMs**

Place your MAME ROMs in /userdata/roms/mame. If you'd like to, you could put ROMs intended for different versions of MAME into subfolders in this folder. For instance, you could put MAME2003-plus ROMs into the /userdata/roms/mame/mame2003plus.

Each romset is specific to the version of MAME being used:

- 0.37b5 romset for the **libretro: imame4all** version
- 078plus romset for the **libretro: mame078plus** version
- 0.139 romset for the **libretro: mame0139** version
- Latest romset at the release of stable for the **libretro: mame/mame** versions

For MESS supported systems, each system has its own folder to use. Putting games designed for the MESS system inside of the mame/ folder will not work.

**Emulators**

**RetroArch**

*RetroArch* (formerly SSNES), is a ubiquitous frontend that can run multiple “cores”, which are essentially the emulators themselves. The most common cores use the **libretro** API, so that's why cores run in RetroArch in Batocera are referred to as “libretro: (core name)”. RetroArch aims to unify the feature set of all libretro cores and offer a universal, familiar interface independent of platform.

There are particular libretro MAME cores available which are based on their equivalent version in MAME. They generally have the same feature set.

**RetroArch configuration**

RetroArch offers a **Quick Menu** accessed by pressing [HOTKEY] + 📌 which can be used to alter various things like RetroArch and core options, and controller mapping. Most RetroArch related settings can be altered from Batocera's EmulationStation.

Standardized features available to all libretro cores: mame.videomode, mame.ratio, mame.smooth, mame.shaders, mame.pixel_perfect, mame-decoration, mame.game_translation
### libretro: imame4all

iMame4All is an old version of MAME that's fairly easy to run, even on hardware as weak as the RPi Zero. Many games, especially newer ones, have known issues with this version. Supports the least number of games.

The romset for this version may be referred to as “0.37b5”.

### libretro: imame4all configuration

### libretro: mame078plus

Not to be confused with the regular MAME2003.

Internally using the name “mame078plus”, MAME2003plus is an old version of MAME that became the “golden standard” for a while. A mixture of being easy to run while supporting the most hardware. Many ROMs, especially newer systems, have known issues with this version.

The “plus” version has had recent developments that don't break compatibility backported from newer versions of MAME. For this reason, regular MAME2003 ROMs may not work in this version.

The romset for this version may be referred to as “078plus”.

### libretro: mame078plus configuration

<table>
<thead>

libretro: mame0139

Internally using the name “mame0139”, Mame2010 is an old version of MAME that's a combination of fast and compatible.

The romset for this version may be referred to as “0.139”.

libretro: mame

The latest version of MAME at the time of stable's release. Check out the table on the arcade guide for the current version.

libretro: mame configuration

</tr>
</tbody>
</table>

Further adjustments can be made to the /userdata/bios/mame.ini file.
MAME

As above!

MAME configuration

MAME offers a **Menu** in-game ([HOTKEY] + or [Tab] on the keyboard). This can be used to manually adjust inputs or game settings. If you're having issues with a specific game, check the MAMEdev FAQ for that game here. For MESS systems specifically, you might find more information on MESS's wiki. All options can also be edited by opening the mame.ini file.

Standardized features available to all MAME systems: mame.videomode, mame.decoration, mame.padtokeyboard

<table>
<thead>
<tr>
<th>ES setting name batocera.conf_key</th>
<th>Description ⇒ ES option key_value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GRAPHICS BACKEND</strong> mame.video</td>
<td>Choose your graphics rendering ⇒ BGFX bgfx, Accel accel, OpenGL opengl.</td>

<td>Rotating display to vertical mode rendering ⇒ Off None, Rotate 90 autoror, Rotate 270 autorol.</td>
</tr>
<tr>
<td><strong>ALT DPAD MODE</strong> mame.altdpad</td>
<td>If the D-Pad does not work properly ⇒ Off (Default) 0, DS3 Orientation 1, X360 Orientation 2.</td>
</tr>
</tbody>
</table>

Further adjustments can be made to the /userdata/roms/system/.mame/mame.ini file.

Controls

Here are the default MAME's controls shown on a Batocera Retropad:

Troubleshooting

MAME is a very complicated project and issues can crop up easily.

None of my games are booting!

First check that the version of MAME you're attempting to run it with is the same as the ROMset you got it from. Mismatched versions aren't guaranteed to run, though sometimes if there were no differences made between MAME versions the game can run in both versions (though that's generally an exception, not the rule).

I have an issue with a specific game

If you're having issues with a specific game, check the MAMEdev FAQ for that game here. For MESS systems specifically, you might find more information on MESS's wiki.
Poor game performance

Arcade games tend to be more difficult to emulate than regular console games in general by their very nature.

With that said, newer versions of MAME emulate these arcade games more accurately than older versions. This generally means that real-world performance takes a dip as more accuracy to the emulation is added (although in some cases, it can dramatically improve performance, really it's on a game-by-game basis).

If your machine is struggling with running a particular game, try using an older set with its respective version of MAME, it may perform better. Just remember to make that special per-game setting to actually utilize the correct MAME version if deciding to go down this route!

I can't open the MAME menu!

Sometimes the key needed to be pressed to access the in-game MAME menu is different depending on which version of MAME you are using. Typically, these keys can be:

- Pushing in [L3] or [R3]
- One of the shoulder buttons/triggers
- [Tab] on the keyboard

If you are specifically using a libretro: Mame core, you can manually activate the MAME menu by going to RetroArch’s Quick Menu ([HOTKEY] + → Options → System → Display MAME Menu. Once this option is activated, exit out of the Quick Menu and you will be greeted by MAME's menu. Repeat these actions to close the menu.

I open the MAME menu too often!

Aforementioned issue, you might have the MAME key set to an in-game key as well. Either set it to another key or remap the MAME menu key.

Further troubleshooting

Most questions are answered in the generic arcade guide.

For further troubleshooting, refer to the generic support pages.
