

# Sega Model 2

This page is **very** under construction.

The SEGA Model 2 is an arcade board released in 1993 by SEGA as a successor to the SEGA Model 1 board. It features several popular arcade games such as Daytona USA, Dead Or Alive, Sega Rally, House of the Dead and Virtua Cop. Most of these had ports to home consoles, some inferior and some superior to their original arcade incarnations. It has an Intel i960-KB CPU at 25 MHz with 9776KB of RAM.

## Controller configuration

Note: A keyboard & mouse is required in addition to your controller(s).

A set on input files is provided however you may want to map your controls per game ROM you intend to run. We recommend you do this using the Emulation Station 'F1' menu option and then choose the model2 config app. **The ROM must be loaded before you can configure the controls.**

Press Esc on your keyboard to go back to 'windowed' mode to then set the controller options if the app goes fullscreen. Once the controls are set, they're saved for future use in Batocera through the normal menu options.
