Under construction. Needs further testing.

Raze

Raze is a fork of Build engine games backed by GZDoom tech and combines Duke Nukem 3D, Blood, Redneck Rampage, Shadow Warrior and Exhumed/Powerslave in a single package. It is also capable of playing Nam and WW2 GI.

“Another day another corpse.” Caleb from Blood.

This system scrapes metadata for the “ports” group(s) and loads the raze set from the currently selected theme, if available.

Grouped with the “ports” group of systems.

Quick reference

- **Emulator:** Raze
- **Folder:** `roms/raze/`
- **Accepted ROM formats:** `.raze`

BIOS

No Raze emulator in Batocera needs a BIOS file to run.

ROMs

Place your Raze ROMs in `/userdata/roms/raze/`.

Each game needs a .raze file to tell Raze how to launch the game, the file need to point to the main game file and add-on file (it's case sensitive).

eg.:

/userdata/roms/raze/Blood - Cryptic Passage.raze (make it easy to scrapper)

/userdata/roms/raze/blood/BLOOD.RFF (main game data)

/userdata/roms/raze/blood/cryptic.zip (add-on data)

/userdate/roms/raze/blood/music/blood02.ogg to blood09.ogg (music data - expects to find it in the same directory as the game's main files or in a /music/ sub-folder of it - mudic files named track02.ogg, track03.ogg, etc are supported but are deprecated, prefer to use the game name instead)

- Music files:

- Blood: blood02.ogg to blood09.ogg
- Exhumed: exhumed02.ogg to exhumed19.ogg
- Redneck Rampage/Route 66: redneck02.ogg to redneck09.ogg
- Redneck Rampage: Rides Again: redneckside02.ogg to redneckrides09.ogg
- Shadow Warrior: shadow02.ogg to shadow14.ogg

- **Supported games (.raze file content and data files location)**:

- One Unit Whole Blood (via NBlood)

<file - Redneck Rampage.raze>
FILE = /redneck/REDNECK.GRP
```

Files from game folder /Redneck Rampage

```
/userdata/roms/raze/redneck/
                           └── REDNECK.GRP
/userdata/roms/raze/redneck/music/
                                └── redneck02.ogg to redneck10.ogg (or
track02.ogg to track10.ogg) (optional)
```

Note: The GOG distribution of the Redneck Rampage Collection does not feature the soundtrack as a loose collection of ogg files. Instead, an Disc Image is provided in the form of a BIN+CUE pair, with the BIN file named REDNECK.gog (or RRRAGAIN.gog) and the CUE file named REDNECK.inst (or RRRAGAIN.inst). The Steam distribution of Redneck Rampage does not feature the CD soundtrack at all, in any form. It is possible to convert the BIN/CUE to .ogg again with https://github.com/hansschmucker/CueToOgg Just copy the .gog and .inst to the CueToOgg root folder and execute CueToOgg.exe, wait until the extract process finish. * Use the same files for Redneck Rampage Rides Again

Raze compatible games: https://zdoom.org/wiki/Raze#Supported_games

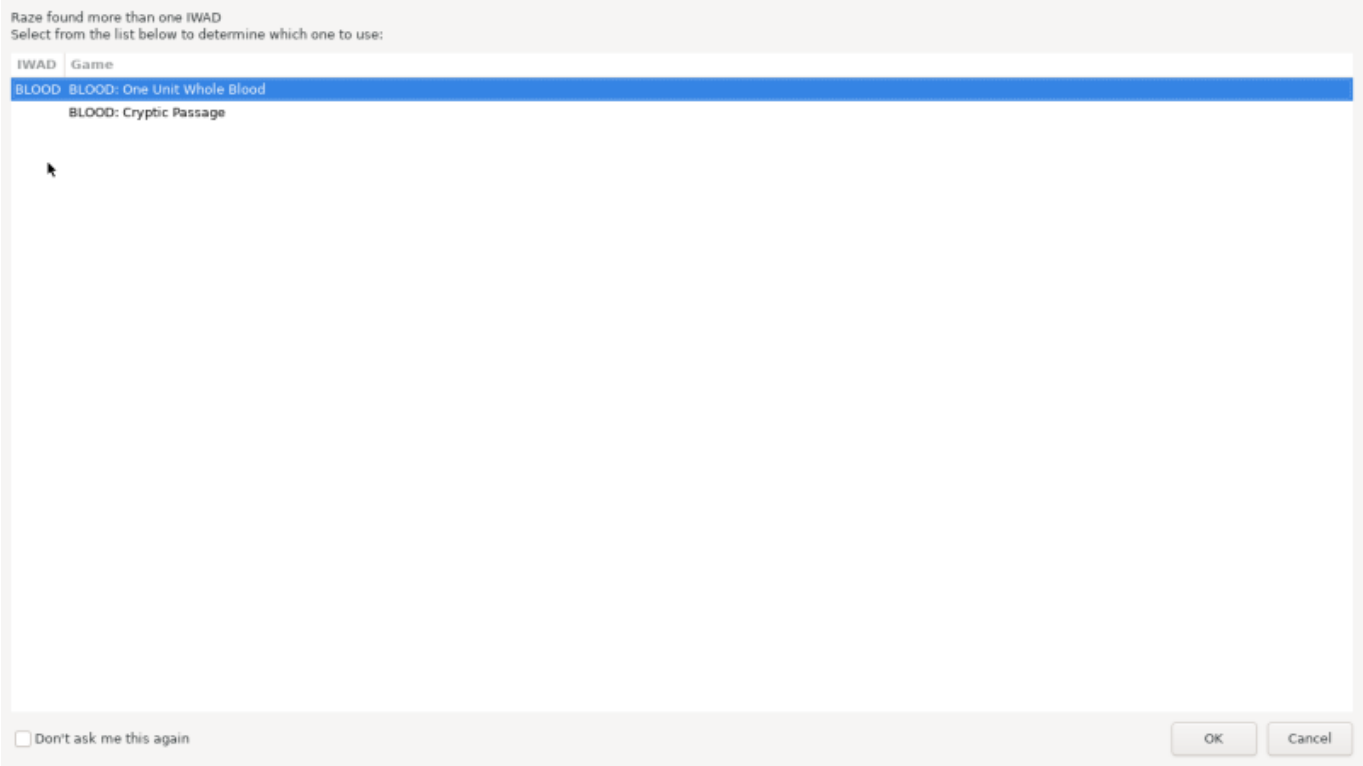

Features

Raze includes the following features:

- Polymost is used as the primary render, but significantly rewritten and separated from OpenGL, utilizing a new texture manager. Polymost is only used in this capacity to generate polygons and sending them off to the backend, which runs on OpenGL 3.3 with the option to use OpenGL 4.5 features. This ensures that new render features can be added to the same backend later, and where a different renderer other than Polymost can also be used
- GZDoom's post-processing effects framework is incorporated, allowing effects such as bloom and faking increased color ranges with dithering to be possible
- A replaced and revamped file system, based on the WAD manager used in GZDoom
- Runs on the full GZDoom backend
- Overhauled input system, with synchronized and unsynchronized modes
- Improved interpolation, both engine-side and game-side
- Skies are rendered as a composite texture, curing the visible seams in many sky textures
- A lighter version of GZDoom's “ZMusic” library is used as music system
- OpenAL is used as sound system
- The menu code from GZDoom is used as a generic system across all supported games
- Support for multiple languages
- Integrated widescreen compatible assets for the supported games
- Games are in their own modules and do not interact with each other. Render, sound system, and input are used universally across the titles
- Controller support is included, using the existing ZDoom controller code
- Multiplayer and networking have a different implementation per game, which are currently entirely nonfunctional and left as-is
- OSD and configuration maintenance replaced with ZDoom's console and config code

Launch Game

When launching a game, if it has an add-on associated, it will be required to select between the main game or the add-on:

Saves

Save location `saves/raze/<game>.<save game extension>`

Emulators

Raze

Raze configuration

Standardized features available to all cores of this emulator: `raze.videomode`, `raze.padtokeyboard`

Controls

🔧Fix Me!

Here are the default Raze's controls shown on a Batocera Retropad:

Troubleshooting

Game does not launch: - Check logs files es_launch_stderr.log and raze.log - Make sure all files are available at roms/azure - Make sure the .raze launch file is setup correctly

1. Check the case sensitive
2. Check the use of FILE, FILE+ and CON
3. Reset system files: delete files from /userdata/system/configs/raze/* and /userdata/saves/raze/*

Script error “raze.pk3:menudef.txt” line 815: Float expected, got 0.5 If the Raze engines does not find the files specified by the .raze file, it will scan the whole shared folder to find them, so it could wrong set a file that could be stored out of roms/azure folder, and will prevent the game to launch correctly. Check the /saves/raze/grpcrccache.txt and remove the line that points to files that are not stored into /roms/azure path. https://github.com/batocera-linux/batocera.linux/issues/7123
