The Sega 32x is an add-on for the Sega Megadrive/Genesis console, released in 1994, retailing for $159.99 USD.

This system scrapes metadata for the “sega32x” group and loads the sega32x set from the currently selected theme, if available.

Grouped with the “megadrive” group of systems. If you do not desire this behavior, you can unset it from 

**MAIN MENU → GAME COLLECTION SETTINGS → GROUPED SYSTEMS**

---

**Quick reference**

- **Emulator:** RetroArch
- **Core:** libretro: PicoDrive
- **Folder:** /userdata/roms/sega32x
- **Accepted ROM formats:** .32x, .smd, .bin, .md, .zip, .7z

---

**BIOS**

No Sega 32x emulator in Batocera needs a BIOS file to run 32x games.

---

**ROMs**

Place your Sega 32x ROMs in /userdata/roms/sega32x.

---

By default, your 32x ROMs will appear in the Megadrive system. If you do not desire this behavior, you can unset it from **MAIN MENU → GAME COLLECTION SETTINGS →**
GROUPED SYSTEMS.

Emulators

RetroArch

RetroArch (formerly SSNES), is a ubiquitous frontend that can run multiple “cores”, which are essentially the emulators themselves. The most common cores use the libretro API, so that's why cores run in RetroArch in Batocera are referred to as “libretro: (core name)”. RetroArch aims to unify the feature set of all libretro cores and offer a universal, familiar interface independent of platform.

RetroArch configuration

RetroArch offers a Quick Menu accessed by pressing [HOTKEY] + ⚙️ which can be used to alter various things like RetroArch and core options, and controller mapping. Most RetroArch related settings can be altered from Batocera's EmulationStation.

Standardized features available to all libretro cores: sega32x.videomode, sega32x.ratio, sega32x.smooth, sega32x.shaders, sega32x.pixel_perfect, sega32x.decoration, sega32x.game_translation

<tr>
<td>video_threaded</td>
<td>Improves performance at the cost of latency and more video stuttering. ⇒ On true, Off false.</td>
</tr>
</tbody>
</table>

libretro: PicoDrive

A lighter emulator which although not as accurate as other emulators, can be run on much weaker hardware. This should be the default for devices such as the Raspberry Pi Zero and other sub-1GHz CPUs. Currently the only cross-architecture option for 32X and Pico games.
