Timezone

By default, Batocera is configured for Central European Time (CET) timezone.

In Batocera v31 and higher, you can select your own timezone from the menu SYSTEM SETTINGS → TIMEZONE. From the same menu, you can also toggle the clock to 12-hour format if you want.

Older versions of Batocera

To adapt to your local time zone, you need to edit /userdata/system/batocera.conf and add/modify a line with:

```
system.timezone=America/Los_Angeles
```

To list all the group names of the available timezone, from SSH/terminal run:

```
# ls /usr/share/zoneinfo/
```

This command returns several directories (each one being a group of time zones). In each of these directories are more directories that contain the actual timezones. For example, to see all the available options for Los_Angeles, run the following:

```
# ls /usr/share/zoneinfo/America/
```

These instructions are still valid for Batocera v31 and higher, if you need to change them manually.
